Staircase-Software Programs

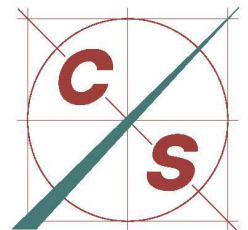

Space saver staircase

Software module for designing and
manufacturing space saver staircases

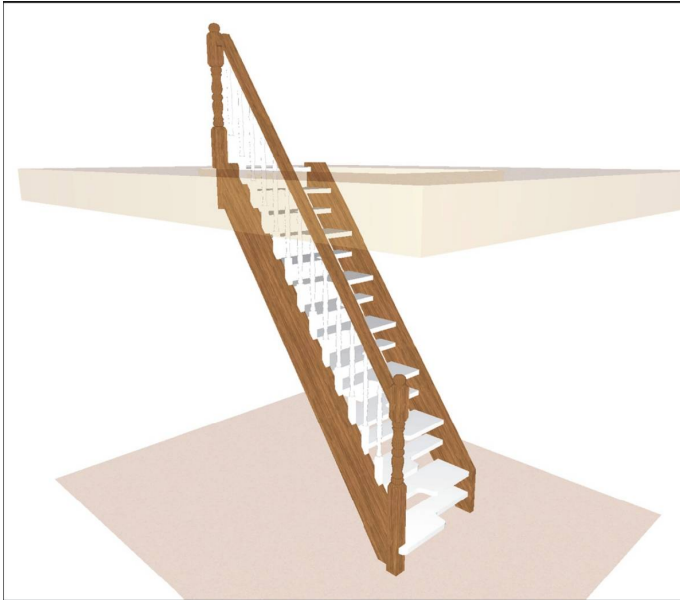

Article no. 00133201

constructing/presenting

Compass Software

The situation on site does often not allow to build in a staircase with a normal size according to engineer standards. A good alternative in this situation are place saver staircases, also called Samba-staircases. This kind of staircase is controversial but often the only alternative in case of missing space.

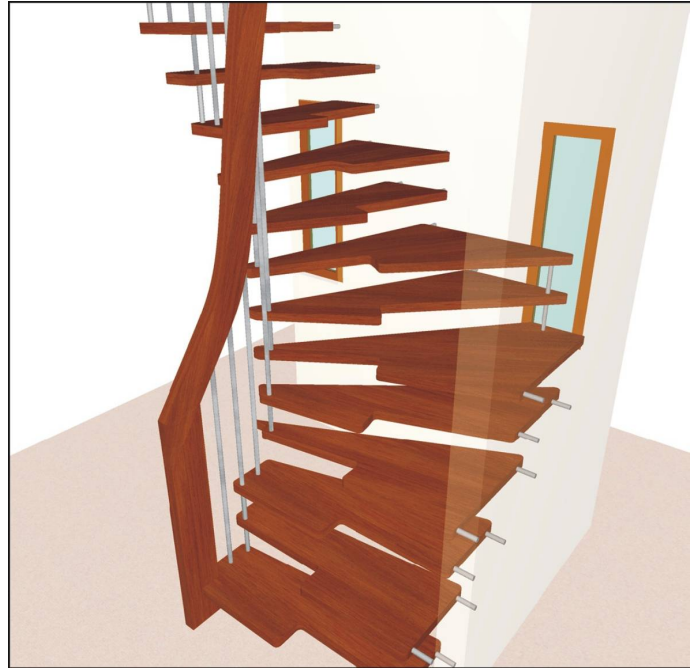

With this additional module, Compass Software now offers the possibility to construct and to design place saver staircases in a simple and nearly automatic way for different types of ground plan - even for turned ones.

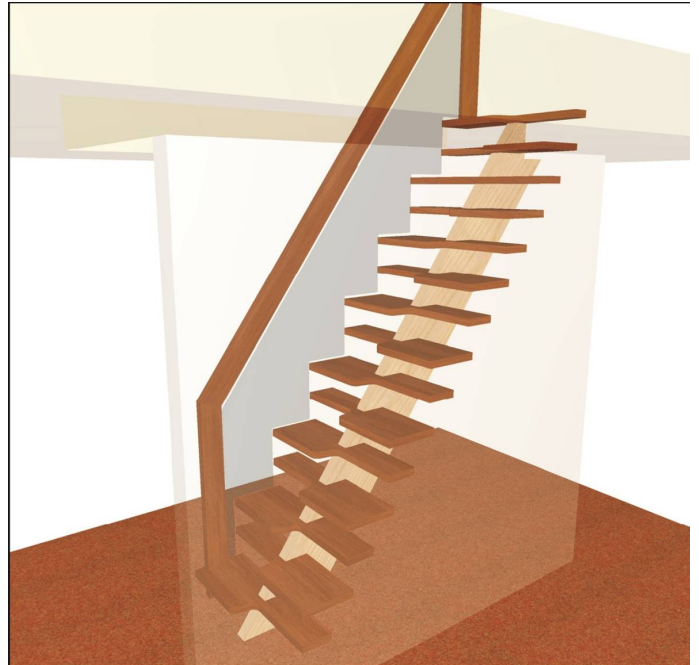

The winding with asymmetrical and changing tread forms is calculated automatically. Each individual tread can be manipulated in the same way as for normal staircases. Straight staircases, turned staircases or staircases with landing can be constructed in this way.

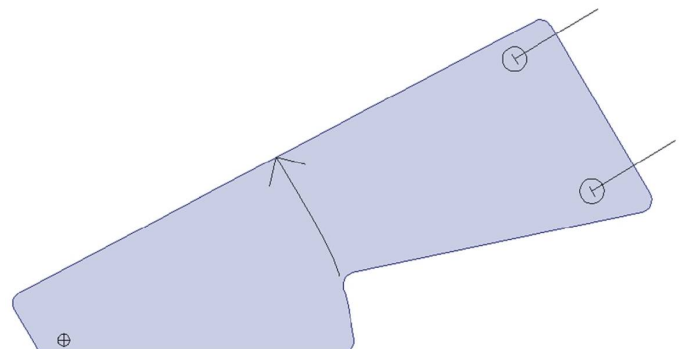

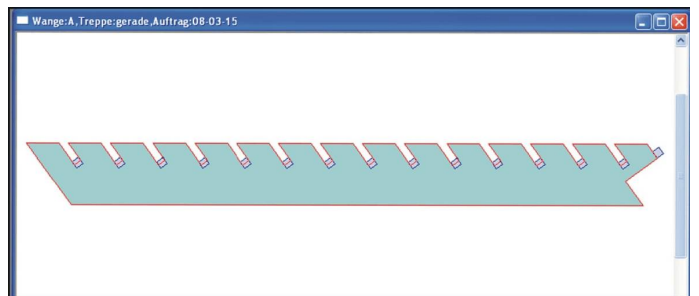

Space saver staircases can be made with stringers or as a bolt construction (with the corresponding option). Even risers or fillets for the protection of children are possible.

Wreaths or posts can be used as a corner joint. In the banister construction all possibilities which are offered by the actual basic version can be used.

CNC-programs can be generated for all parts such as in the case of normal staircases, provided that the corresponding software modules exist.

Article no. 00133201

Option CAD Space saver staircase

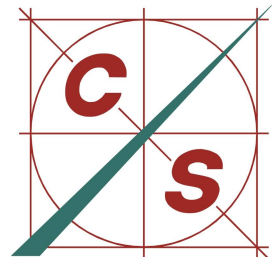

- space saver treads with all kinds of staircases
- different tread forms
- parameterised tread forms
- landing or completely winded space saver treads
